ABSTRACT:

PROBLEM TO BE SOLVED: To provide an excellent dyeing process for a sheath-core type conjugated fiber that can uniformly dye the sheath-core type conjugated fiber without striated unevenness.

SOLUTION: In the dyeing of a sheath-core type conjugated fiber, a polyamide modified with a sulfonated aromatic dicarboxylic acid is formulated to the sheath part at a formulation ratio of 25-75 wt.%, while a polyester modified

with a sulfonated aromatic dicarboxylic acid is formulated to the core part and the resultant conjugated fiber is dyed by using a level dyeing agent and substantially a cationic dye.
